

Marketplace

Description

Marketplace will be a website, where people will have a chance to post different things to sell and others will be able to choose and buy different stuff. It will be like an online store, where user can find new or also used items. User will be able to choose from several categories and sort products or search with different values. Each post will have a picture, price, description, publish date and contact information of the seller. User should register and login to put something on the website.

Software

I will use three-tier architecture to build a project. For the back-end framework I will use Django and will work with python to run the business layer. It will be connected to databases using MySQL. It will update the user database when the new one will register and also, it will store the product information. For the front-end I will simply use HTML/CSS, Javascript.
